

# Amino Orchestrate

Centralized visibility, management and control of deployed devices - anywhere

## Strengthen enterprise deployments' low-touch, out-of-sight goals

Amino Orchestrate simplifies device management across multiple locations through its cloud-based tools. With an intuitive web interface, it streamlines firmware, configuration, and application management for individual or groups of devices, all with just a few clicks. Additionally, it empowers users to swiftly resolve issues by remotely viewing and controlling customer screens and menus.

## Benefits

**Reduce time to resolution**

**Centralized device management and software updates**

**Enable zero-touch deployment of screens**

## Key features include

**Powerful device diagnostics**

**Manage and schedule firmware and application updates**

**Device speed tests for confirming network bandwidth**

**Remote view and control what is on your screens**

**APIs and SSO support seamless tool integration**

**Log and bug report tools ease troubleshooting**

## Simplify Management

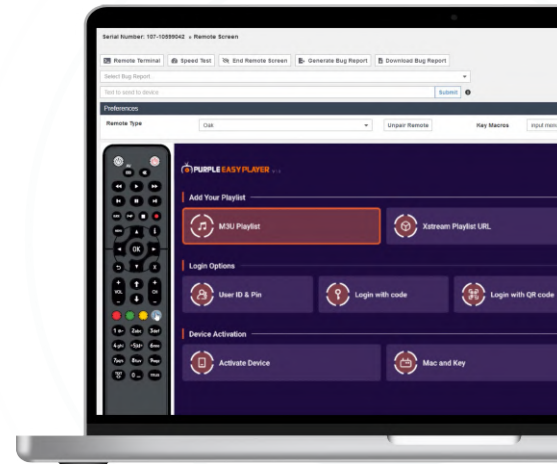

Amino Orchestrate makes it easier for technicians to manage devices, software and device configurations. Technicians take control by managing devices via a common browser. They have the flexibility to customize their view of deployed devices by creating target device groups and simply clicking-to-assign new software and device configurations.

**Orchestrate** makes it easy to test new code or device configurations on "friendly" devices before deployment to production environments. This is done by simply selecting the test device group and assigning the desired firmware/device configuration. Once tested, users can simply launch new devices with the same configuration/firmware through zero-touch provisioning. This makes it easy to roll out or replace devices in a geographic location or commercial environment by simply adding the device serial to the required device group prior to installation.

## Centralized Monitoring

A key advantage of the platform is how on-screen content can be viewed remotely via the UI, enabling centralized video teams to validate video delivery or troubleshoot issues. With a real-time view of the screen it is possible to validate device performance. If it is not functioning as expected, Orchestrator makes it easy to identify and fix the issues remotely.

- **View and remote control** of on-screen menus
- **Diagnostic data** includes network ping, speed tests, and performance metrics for media players and screens
- **Enable** device logging, reboot, factory reset, and access a command line terminal for deeper diagnostics and resolution

## Validate Device Performance

Amino Orchestrator ensures your screens display content correctly, protecting your brand with quick problem resolution and lower support costs. As a cloud-based platform, Orchestrator offers enterprise-level reliability, making content delivery to any screen effortless.

## Orchestrator offers two tiers of service

**Starter** has the key functions to manage and deploy your H200 devices quickly and securely: a license is included with each H200 sale.

**Premium** includes all features of starter but also gives the remote view and control functionality and provides access to the integration APIs.
